DESCRIPTION: Position within sector: Central part of S of Area C
 Shape: Irregular

For layers complete this section:
 Surface (slope direction; visible inclusions): W side slopes slightly toward the E, most of visible inclusions are pebble to boulder-sized
 Observations about inclusions (Clusters? Deposition slope): slightly more fine ware fragments on W side of SU, other inclusions fairly evenly distributed.
 Observations about thickness (Increases? Decreases?): uniform thickness across layer
 Nature of the interface with layer below: sharp diffuse commingled other (specify)

For cuts complete this section:

Cut edges: rounded straight
 Cut sides: straight concave convex sloping
 Cut bottom: flat concave irregular

INTERPRETATION

layer composed of ^{remains of} topsoil and covered most of the southern half of area C (south of drainage channel), excluding the western most edge of area C and the very topmost part of the tufo walls in the eastern section. Peered off a fairly thin layer across trench to expose tops of walls on W end + remove last of topsoil left by digger
