INTERPRETATION

This SU was defined around a possible robbing trench of N-S wall (SU2245). No clear cut edges were identified during excavation. ~~That~~ Some stratigraphic changes in the SU could be indicative of robbing activity, with the central area of the SU having brown soil, while the outer sections sides being orange/red. The inconsistent colour change makes positive identification problematic of a cut problematic. Degradation of the tufo wall and natural accumulation in the spa is a possible interpretation of the fill.
